

OWNER'S GUIDE

How the Codebase Works

A simple guide to GitHub, Vercel, Render, and Supabase, plus how to use Claude Code to make changes.

HOW THE ALLEATO PLATFORM WORKS TOGETHER

THE WHOLE SYSTEM

One codebase. Two runtime layers. One shared platform foundation.

GITHUB SHIPS THE CODE. **VERCEL** SERVES THE WEB APP. **RENDER** RUNS BACKEND SERVICES. **SUPABASE** HOLDS SHARED DATA, IDENTITY, AND FILES.

The same system, with direct links and plain-English detail.

Select any platform to open the Alleato account page in a new tab.

Describe the result. Let Claude inspect the project before it changes anything.

Start a Code session, select where the project lives, then describe the outcome you want. You remain the approver.

1

Start a Code session

Open Code, then select New session.

2

Select the project

Cloud: choose the GitHub repository. Local: choose the folder containing the code.

3

Confirm the location

Check the repository or folder and the active branch shown above the prompt.

4

Describe the outcome

Say what should change, who it helps, and what success looks like.

5

Review and test

Inspect Claude's plan, the changed files, screenshots, and test results.

6

Create the GitHub change

Commit, push, and open a pull request when the work is ready.

A useful prompt formula

"For [type of user], improve [specific workflow] so they can [business outcome]. First inspect the existing implementation and project rules. Show me your plan, test the real workflow, and report what changed, what passed, what remains, and any risks."
